Geometric programming is a technique whereby objective and inequality constraints expressed as posynomials and equality constraints as monomials can be transformed into a convex program. Integer programming studies linear programs in which some or all variables are constrained to take on integer values.

Mathematical optimization - Wikipedia

Mathematical programming, and especially linear programming, is one of the best developed and most used branches of management science. It concerns the optimum allocation of limited resources among competing activities, under a set of constraints imposed by the nature of the problem being studied. These

Mathematical Programming: An Overview 1

This book focuses on mathematical modeling, describes the process of constructing and evaluating models, discusses the challenges and delicacies of the modeling process, and explicitly outlines the required rules and regulations so that the reader will be able to generalize and reuse concepts in other problems by relying on mathematical logic.

Mathematics is used in programming at very basic levels without it you can not make algorithms. It would be correct to say algorithms are actually an interpretation of algebraic mathematics. Let me give you an example. Try to make a program in c/c++ that can separate the digits of a number and show them separately.
